*% detected as AI

AI detection includes the possibility of false positives. Although some text in this submission is likely AI generated, scores below the 20% threshold are not surfaced because they have a higher likelihood of false positives.

Caution: Review required.

It is essential to understand the limitations of AI detection before making decisions about a student's work. We encourage you to learn more about Turnitin's AI detection capabilities before using the tool.

Disclaimer
Our AI writing assessment is designed to help educators identify text that might be prepared by a generative AI tool. Our AI writing assessment may not always be accurate (i.e., our AI models may produce either false positive results or false negative results), so it should not be used as the sole basis for adverse actions against a student. It takes further scrutiny and human judgment in conjunction with an organization's application of its specific academic policies to determine whether any academic misconduct has occurred.

Frequently Asked Questions

How should I interpret Turnitin's AI writing percentage and false positives?
The percentage shown in the AI writing report is the amount of qualifying text within the submission that Turnitin's AI writing detection model determines was either likely AI-generated text from a large-language model or likely AI-generated text that was likely revised using an AI paraphrase tool or word spinner.

False positives (incorrectly flagging human-written text as AI-generated) are a possibility in AI models.

AI detection scores under 20%, which we do not surface in new reports, have a higher likelihood of false positives. To reduce the likelihood of misinterpretation, no score or highlights are attributed and are indicated with an asterisk in the report (*%).

The AI writing percentage should not be the sole basis to determine whether misconduct has occurred. The reviewer/instructor should use the percentage as a means to start a formative conversation with their student and/or use it to examine the submitted assignment in accordance with their school's policies.

What does 'qualifying text' mean?
Our model only processes qualifying text in the form of long-form writing. Long-form writing means individual sentences contained in paragraphs that make up a longer piece of written work, such as an essay, a dissertation, or an article, etc. Qualifying text that has been determined to be likely AI-generated will be highlighted in cyan in the submission, and likely AI-generated and then likely AI-paraphrased will be highlighted purple.

Non-qualifying text, such as bullet points, annotated bibliographies, etc., will not be processed and can create disparity between the submission highlights and the percentage shown.

THE RESEARCH ON COLLEGE PLACEMENT PORTAL SYSTEM

ABSTRACT: The issue of which is which of quick, smooth set ups that do it automatically and leave the user at the same place to handle office and school tasks has been reported out by the large scale introduction of digital tools in higher education. We see the growth of a strong student section in the core which in turn develops in depth online profiles that include info about a person's background, academic performance, practical and interpersonal skills, extra curricular activities, projects, credentials and career goals. You may look at job openings, who is a fit based on qualifications, how to put in your info for open positions, how to post your resume online, and real time application status updates through campus events. Also as opposed to going the manual route you save time and trouble and miss less opportunities because of timely alerts. This system provides better overall results, and offers a detailed overview of each shortlisted candidate's movement through the various stages, including interviews, hiring decisions, and job offers, ensuring that no detail is overlooked. The T&P Office manages campus placements, verifies company data, cross-references it with student data, and tracks the recruitment status.

I. INTRODUCTION

Due to the large number of placement drives, final year engineering students and students from the third year of engineering become anxious as the placement season approaches. Students want to evaluate their employment opportunities and seek advice on how to increase their employability. In this context, the management underlines the importance of the placement officer, and disseminates information regarding the preparatory steps to be taken prior to the commencement of the placement season. The focus on hand-based work reinforces the need for educational institutes to undertake training and placement functions. The training and placement officer (TPO) communicates to the students, all the information regarding training and placement functions. To advance and simplify the placement process, a web-based solution can be created for students and the training and placement department. This solution will create a web-based regional network of training and placement cells to notify students and colleges regarding placement events. This method enables placement officers to provide students with more relevant guidance and enhances the information flow regarding emerging companies. The Placement Management System, a web-based platform designed for instructors and students at colleges and universities, is a crucial part of managing student placements. The Placement Management System is a web-based tool that aids instructors and students in colleges and universities that is essential in handling student placements. It also provides guidance on institution selection; assists students academically; and provides information about policies and procedures. Placement Officers have oversight responsibilities for students' records, documents, and profiles. Given the volume of soliciting companies, the task of collating this information manually is a challenge. This process entails the building of student profiles across multiple streams and the provision of instant notifications for any updates that meet the criteria of the hiring companies. The manual management and upkeep of student information is replete with challenges - its complexity, the time it takes to manage it, and the risk of information being missing or outdated. Various accounts such as Admin, Student, and HOD, along with other credentials, come with the creation of the Placement Management System. Role-based and protected access is therefore ensured. Based on the criteria established by particular companies, the system compiles a list of eligible candidates for interviews. Students can decide to participate in events, tests, or drives.

II. RELATED WORK / LITERATURE SURVEY

Despite the fact that numerous platforms and studies aim to improve the technical skills and placement preparedness, numerous research gaps still exist. In the current market, MOOCs such as Coursera, Udemy, and NPTEL offer high-quality courses. However, they don't help in timely placement preparation as per the academic calendar.

Students in the Engineering field tend to focus on rote memorization rather than understanding the material, resulting in cognitive overload and the inefficient development of necessary skills.

A. Fragmented Learning Ecosystems

Research has found that students spend more time contemplating where to find reliable information than actually learning. The lack of structure and organization in knowledge, skills development, and learning hinders the rate and quality of skill improvement. Placement preparation is unstructured and is thus, in most cases, less effective than the other academic streams where students follow a prescribed curriculum.

B. Academic–Industry Skill Gap

The literature on employability skills tends to focus on the gap between academic skills such as maths, physics, and theory, and those required by industry such as DSA, communication, project work, and domain-specific skills. Inadequate exposure to the real job requirements at an early age in the program, students fail to adapt their learning strategies.

C. Absence of Personalized Guidance Research demonstrates that while there are individualized learning paths which exist, most platforms do not in fact adapt to the skills, grades, and strengths of the students. This in turn creates large scale trends in preparation which may not in fact be effective for all.

D. AI's Application to Candidate Profiling AI which is true of today's modern hiring systems that use it for resume sorting out, job candidate matching, and predictive analytics. Also we see that machine learning based recommendations play a large role in improving the decision making of both students and recruiters.

E. The function of chatbots and mock interviews In also report that in the field of conversational AI we are seeing how chatbots play a role in improving communication skills and increasing interview confidence. Students profit from AI powered feedback which is a break from what we have seen out of traditional systems. Also we see the research which puts forth the case for a special system which

includes smart automation, placement info, prediction models, and structured learning exactly what E-GUIDE is.

III. PROBLEM STATEMENT

S.No	Problem Area	Short Explanation	Impact on Students
1.	No Roadmap for Structured Placements Students	need guidance on how to prepare for placements by year	resulting in confusion, poor understanding, and starting late.
2.	No Centralized Industry	Data Students remain unaware of recruitment trends and what companies are looking to hire.	This results in wasted applications that are unqualified or ignorant.
3.	Decentralized Learning Resources	Although online resources exist, the poorly organized and abundance of options are demotivating	unproductive, and a waste of time.
4.	Little Relevant Job Applications	Students apply without consideration of the roles, skills	or alignment resulting in a loss of confidence and lower selection rates.
5	No Clear Assessment of Placement Chances	Students are left in the dark on the metrics and evaluation around readiness or likelihood of selection.	This leads to a lack of direction on strategic improvement and increases uncertainty.
6	TPO Manual Guidance	TPO performs manual verification of questions, resumes, and eligibility.	Also they are slow at it, prone to errors and not very effective.
7	Unreliable Preparation Tracking	There are no systems in place for skill development or roadmap advancement.	Learning is inconsistent and uneven.

IV. VISION

By building out a smart, structured AI powered ecosystem which from day one we put our students in the driver's seat E-GUIDE is out to transform the way engineering students prepare for placements. We see a world in which all students no matter their background, academic record, or past experience have equal access to top quality placement advice, relevant resources, and personal insights that in turn help them make sure footed career choices with confidence.

V. MISSION

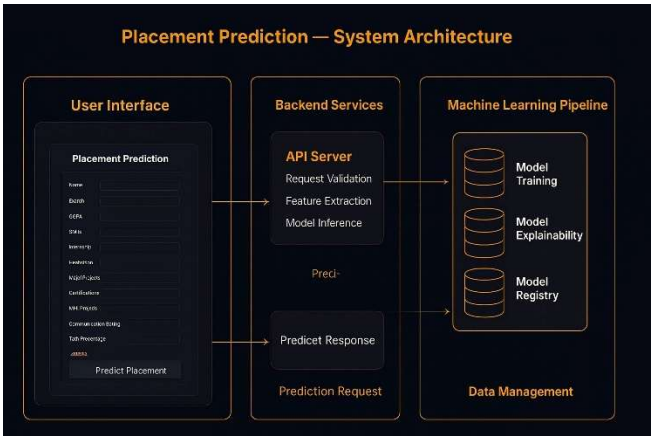
1. We will present domain and year specific study plans.
2. We will report current, precise hiring info from all companies.
3. AI will put forth job suggestions based on a student's skills.
4. We will do placement outcome analysis to put forward targeted improvement which in turn will raise confidence, also we will do simulated mock interviews.
5. We will automate the institutional placement process.
6. Put in place technologies that are safe, large scale, and easy to use.

VI. PROPOSED WORK

Module	Description	Purpose
Roadmap Maker	Develops preparation programs for each term (coding, aptitude, projects, resumes).	sets out a structured path for learning.
Manager of the Company Database	Tracks down roles, issues related to hiring, and criteria.	enables for good planning.
AI-Powered Job Matcher	Aligns student profiles with ideal job roles.	Tailored role targeting.

Placement Probability Analyzer	Selection probability is determined by a machine learning model.	which improves performance and focus.
Mock Interview Bot	AI virtual assistant that replicates technical and HR interview processes of which which.	increases preparedness for interviews
Resume Analyzer	NLP model identifies weaknesses and strengths.	improve the quality of the resumes
Admin Panel	Tool for recruiters and advanced analytics	assist TPO in better operation management

VII. SYSTEM ARCHITECTURE



1. User Interface (Frontend)
We have what is called "Placement Prediction" a tool which collects info on students which includes:.

- Name
- Exam scores
- CGPA
- Skills
- Internship details
- Hobbies
- Major projects
- Certifications
- Mini projects
- Communication rating
- 12th percentage
- This info is sent to the server side as a Forecast Call.
- We have a Predict Placement button which when you click it sends off your info. The API server's responsibilities of.

2. Backend Services

- The responsibilities of an API server
- Request Verification
- Does in the gaps at the same time that we ensure accuracy of each detail.
- Feature Extraction
- Translates raw user input into the machine language that the AI models require, we use the collected info to put together what the algorithm will accept.
- Model Inference
- Uses proven models to determine the chance of a breach.
- Forecast Reaction
- After completion it returns a report which says "yes" or "no", "odds" and also includes possible tips.

3. Machine Learning Pipeline
Handles the main ML functions:

- Training of Models
- Uses data from students to train the computers.
- From past trends which are noticed as opposed to rules it is trained to see what fits.
- Model explainability.
- Outlines the basis of the forecasts. - Identifies which elements are most important.
- Shows which parts are most important.
- Model Registry
- Maintains many versions of the trained models which we keep in an organized way for when they are needed.
- Ensures the top model runs smoothly.
- We also see to it that the best model is running at its best.

4. Data Management
Handles every facet of machine learning data and ensures its up-to-date status in storage. While dealing with storage, it should be noted that updates occur in a timely so as to keep the storage current. He/She handles documents, practice data and results of systems, all of which are used in the future to enhance the systems.

VIII. KEY FEATURES

1. Placement Roadmap by Year It is a structured preparation plan that spans all four years and covers all aspects of

programming, aptitude, DSA, project work, soft skills, and interview training specific to a company. It provides a clear path to eliminate ambiguity.

2. Hiring & Eligibility Database of the Company This offers comprehensive details about the company's hiring standards, recruitment cycles, necessary skills, compensation packages, and historical hiring trends. Students are able to plan strategically and set goals that align with industry standards thanks to this consolidated information.

3.Hiring and Eligibility System of the Company which is a repository of info on our hiring policies, when we hire, what skills we look for, what we offer in terms of compensation, and also past hiring trends. Also we have put together a one stop shop of this info which in turn allows students to set out a strategic plan and set goals which in sync with industry standards.

4.We have an AI which maps out the student profiles into job roles based on what they did in school, their skills, and what they are interested in which in turn we feel is a great tool which increases the chance of a very targeted and successful job application.

AI Resume Scanner that which automatically goes over resumes for structure, content quality, keyword use, and ATS fit we provide students with scores and also suggestions for professional growth. We have support for AI Chatbots and Mock Interviews which allows students to practice through simulated technical and HR interviews thus improving their confidence, communication skills, and familiarity with typical interview settings. Dashboard for Admin Analytics Platform which placement officers use to track students' preparation, see performance trends, determine what the eligibility requirements are, and manage placement data with easy to understand visual charts.

IX. IMPLEMENTATION

1. Front-end
• HTML5, CSS3, and React.js
• Bootstrap/tailwind
• Designing for mobile

2. Server side
• Express.js and Node.js
• MongoDB/Firebase

3. AI models
• Recommendation Engine (content-based filtering);
• ML Classification Model;
• NLP-based Resume Evaluator

4. Integration
• AWS, Netlify, and Vercel

5. Operational Procedure
• The pupil logs in
• Reviews the companies and the associated roadmaps
• Uploads a CV
• AI scoring and recommendations are received
• Jobs are applied
• The system predicts placement probability.
• The student attends a mock interview.
• The student monitor the admin's analytics

X. RESULTS

• Because the roadmap offered straightforward and sequential instructions for their preparation, the students expressed a boost in confidence and a feeling of organization.
• The AI job matching feature helped students make role selections, thus lowering confusion and the chance of random applications.
• The placement probability feature helped students self-assess so they could concentrate on the right factors.
• The CV analyzer improves and professionalizes students' CVs.
• Mock interviews and AI chatbots provided students an interview practice avenue and boosted their confidence and communication skills.
• Student preparedness and data handling insights provided by the admin dashboard were useful for placement officers.
• Overall, the platform provided placement preparation that was more organized, less anxious, and more motivating.

XI. FUTURE SCOPE

1. Training Plans Powered by AI
2. Full Mobile Apps Integration
3. Education and Gamification: XP, Rewards, and Badges
4. Peer Groups & Community Assistance 5. Automated Business Pattern Analysis
5. Automated Business Pattern Analysis
6. AI Models for Interviews by Voice
7. AI-Based Optimization for LinkedIn Profiles
8. A hybrid recommendation system based on deep learning
9. Direct connection to hiring portals of the real world
10. Complete Process Automation of Hiring for Educational Institutions

XII. CONCLUSION

Educational institutions and students value the Training and Placement Module's benefits. It allows students to monitor their progress and identify gaps to enhance their skills. It aids the training and placement department by providing a system that increases productivity and saves time. The system is self-rewarding and encourages students to work harder and to choose wisely about their education and careers. E-GUIDE transforms the placement preparation ecosystem by providing a single platform that combines structured roadmaps, job matching via AI, predictive analytics, and interactive mock interviews. It provides students with clarity, direction, and personalized feedback as it removes the uncertainties, inefficiencies, and shortcomings of the existing placement preparation systems. Placement experience is revolutionized with decreased manual work for placement cells and predictive intelligence for students. For any academic institution seeking to modernize its placement systems, E GUIDE can prove to be an integral part of digital planning.
